

INTEGRATIONS

We establish links with integration partners and connect systems with meaningful and impactful outcomes for those you support such as medication integrations (eMAR), pain management and interoperability systems like GP Connect and eRedBag. By integrating with quality partners, Nourish becomes a central system that meets all of your needs.

GP Connect

GP Connect was introduced by the NHS and aims to support better care by surfacing valuable information held within GP Practice for use across health and social care. The GP Connect integration within Nourish enables care providers to review GP records and medical notes of those they support in real time, enabling them to make better, more informed decisions and provide the most safe and effective care.

PainChek®

Nourish and PainChek have partnered to bring a unique solution to the Nourish community which forms part of the Pain Management collection. The unique integration with Nourish surfaces key information, enabling powerful analysis alongside the rich data within Nourish to implement proactive solutions over time. With the support of PainChek technology we want to empower care teams to enhance the already expert person-centred care they provide.

eMAR

We've integrated with a number of leading eMAR providers. These integrations push vital medication information directly into Nourish, so care teams have everything they need in one place. Along with an individual's personalised timeline and care plan, you'll be able to see information such as current prescriptions, medication history and a detailed log of medication that has been administered or missed.

We are always looking to integrate with businesses who can improve the lives of the people we support and have some exciting integrations in the pipeline that can assist with falls prevention and more...
